                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  epitope from M. tuberculosis protein ESAT-6, or MPT59 and a second condifferent amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo concentration or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid fragment care useful as pharmaceuticals, for diagnosis of and as antigens for care useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or povis. The polypeptides are also useful for diagnosing or previous sensitization in an animal with bacteria belonging to the cuberculosis complex. The invention also describes the use of CFP7A or CFP3OA or T-cell epitope of for the induction of a strong immune cresponse in a mammal; use of CFP7B, CFP19 or MPT59-8SAT6 or a T-cell epitope of for diagnosis of TB in a mammal by performing a DTH type skin test; use of CFP27, CFP3OA, RDI-ORF2, RDI-ORF3, RDI-ORF3, MPT59-SSAT6, CESAT6-MPT59, CFP1OA, CFP1OA, RDI-ORF3, RDI-ORF3, RDI-ORF3, RDI-ORF3, MPT59-SSAT6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDs 9692-16825 represent a group of 7134 Mayococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                     23-OCT-2003
07-AUG-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of macrolides by microorganisms. In particular it relates to the nucle: acids forming the biosynthetic locus for rosaramicin (a 16-member macrolide antibiotic) from Micromonospora carbonacea. The invention is useful for the biosynthesis of macrolides by microorganisms. It allows direct manipulation of macrolides and related chemical structures by chemical engineering of the proteins involved in the biosynthesis of rosaramicin. It is useful to catalyse certain biochemical reservices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rosaramicin. It is useful to catalyse certain biochemical reactions, in vitro or in vivo, to direct or enhance the synthesis or modification of polyketide, polyketide substrate or its prescursor. The present sequence is M. carbonacea polyketide synthase (PKS) type I protein. (Updated on -OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1574 AA;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16196-ABL30511), expressed DNA sequences (ABL01640-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a Mycobacterium tuberculosis N-terminal peptide. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from Atuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the dispnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated mycobacteria polypeptides and nucleic acids developing products for the diagnosis of or vaccination a mycobacterial infections, particularly tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a substantially pure immunogenic polypeptide CC fragment (I) from Mycobacterium tuberculosis that is able to evoke a CC protective immune response against infections by mycobacteria belonging CC to the tuberculosis complex. The invention provides a (1) fusion CC polypeptide comprising at least one polypeptide fragment (I) and at least CC one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell CC epitope from M. tuberculosis protesin SBAT-6, or MPTS9 and a second CC different amino acid sequence from M. tuberculosis, and/or including a CC sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment CC that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or CC waccination against TB caused by Mycobacterium tuberculosis, africanum or CC covis. The polypeptides are also useful for diagnosing ongoing or CPP70 or CC covis. The polypeptides are also useful for diagnosing ongoing or CPP70 or CC covis. The polypeptides are also useful for diagnosing ongoing or the CC cuberculosis complex. The invention also describes the use of CPP70 or CC cP30A or a T-cell politope of for the pitope of for the induction of a strong immune CC epitope of for diagnosis of TB in a mammal by performing a DTH type skin C est; use of CPP27, CPP30A, RDI-ORP2, RDI-ORP3, RDI-ORP5, PCP30B, CPP7B or a T-cell epitope of for the preparation of an immunological composition; and CC cell epitope of for the preparation of an immunological composition; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 755

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC microbial source: The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant is maize or soybean. The method of producing a transformed plant CC recombinant DNA construct and growing the transformed plant with the CC recombinant DNA construct and growing the transformed plant, where the CC polynucleotide or polypeptide is useful for improving plant with the CC improved plant properties, e.g. improved cold, heat or drought tolerance, CC ingrance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of CC content, improved yield by modification of carbohydrate, nitrogen or CC content, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan CC growding improved plant growth and development under at least one stress condition. CC prowder functional in a plant cell, where the promoter is positioned to CC provide for expression of a polynucleotide encoding a polypeptide from a CC comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprise sing the plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property. The plant is a crop plant crombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with CC improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic cormat from USPTO at sequence approved sequence.html.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property attansforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties, improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (HINK/)

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL01616-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
   New DNA sequence encoding polyketide synthase, useful for the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S. cinnamonensis MonAIV/polyketide synthase multi-enzyme MONS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-JAN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 621 AA;

δ

of polyketides such as antibiotic monensin

CC cluster (and is capable of expressing a corresponding polypeptide), and CC hybridization probe derived from the gene cluster (for identification and CC isolation of the same or analogous gene cluster, e.g. one which binds gpecifically to a region of the monensin gene cluster selected from mon CC BI, mon BI, mon CI, mon CI, mon H, Mon RI, mon RII, mon T, mon AIX and CC mon AX), the use of the mon RI gene or variant and a monensin promoter to CC control expression of a heterologous gene in Streptomyces cinnamonensis, CC a polypeptide encoded by a portion of the monensin gene cluster (preferably comprising mon BI, mon BI, mon AIX or mon AX or their control expression of a heterologous gene in Streptomyces cinnamonensis, CC enhanced levels of production of monensin comprising engineering it to cyclase enzyme encoded by mon CII, producing S. cinnamonensis capable of coverexpress the mon RI gene, S. cinnamonensis capable of coverexpress the mon RI gene, S. cinnamonensis capable of containing a heterologous gene and expressing a gene heterologous to S. cinnamonensis comprising transforming S. cinnamonensis with DNA CC containing a heterologous gene and expressing the gene under control of the activator gene mon RI or actil/orf4 and 13-propyl erythromycin A. The corresponding antibacterials (enzyme systems, nucleic actids and vectors) are useful for preparing polyketides by recombinant synthesis. The corresponding antibacterials or or other pharmaceuticals. In particular the gene is useful for the production of monensin, an antibiotic polyether contain capable or polyketides. The present sequence represents a protein encoded by the The invention relates to a DNA sequence which is a fully defined sequence of 103551 base pairs appearing as ABX04971, or its variant, that it is not a sequence encoding all or part amino acids 1-920 encoded by mon AI as given in the specification. The DNA is the S. cinnamonensis polyketide antibiotic momensin biosynthetic gene cluster. Also included are a recombinant cloning or expression vector comprising the gene cluster, a transformed host cell which has been transformed to contain the gene Sequence 4038 AA; monensin gene cluster

Large subunit of periplasmic nitrate reductase NapA

NapA; toxic periplasmic nitrate reductase; enzyme; transgenic organism; waste denitrification; denitrifying bacteria.

Pseudomonas sp.

This sequence is the large subunit of periplasmic nitrate reductase. The NapA gene can be used to create transgenic organisms that can denitrify toxic waste. In addition, the present sequence may be used to produce probes and primers for identification of new denitrifying bacteria. Residues 20 to 853 of the present sequence are encoded by the accuracy in processions 20 to 853 of the present sequence are encoded by the accuracy.

                                                                                                                                                                                                                                                                                                                                                                                                 subunits. Also included are a chimaeric gene comprising the Map nucleic acid linked to regulatory sequences, a transformed cell comprising the chimaeric gene and a nucleic acid fragment encoding an enzymatically active bacterial periplasmic nitrate reductase subunit, obtained by probing a library with the Map nucleic acid and sequencing the isolated clone. The Map nucleic acid is useful for producing enzymes useful in denitrifying reactions (for water purification and industrial waste purifying) and for identifying other denitrifying bacteria. Also disclosed are the nucleic acid and protein sequences for the nitric oxide reductase subunit genes NorE, NorC, NorQ and NorD. The present sequence represents the Mapa protein. Note: The present sequence is stated to be encoded by the DNA appearing as ACD26043 but is not encoded by it.
